MAIN FINDINGS AND ARGUMENTS

- AI is becoming a normal part of higher education, not just a tool for cheating.
- Students use AI for studying, research, proofreading, coding, simulations, analytics, and creative projects.
- AI use is becoming specialized depending on each student's major or field of study.
- Professors and universities are also using AI for grading, coursework planning, and admissions support.
- The article argues that universities should create ethical AI guidelines instead of banning AI completely.

BROADER IMPLICATIONS FOR SOCIETY

- AI is changing how people learn, work, and prepare for future careers.
- Many routine workplace tasks may eventually be handled by AI, allowing humans to focus more on innovation.
- Students need to learn how to use AI tools while still understanding the fundamentals of their field.
- AI could make education more personalized by adapting instruction to each student's needs.
- Higher education may become more accessible through virtual learning and AI-supported instruction.

WHY IT MATTER IN CONSTRUCTION?

- Construction education will need to teach students how to use AI responsibly in real project workflows.
- AI can help future construction professionals with estimating, scheduling, safety planning, document review, and communication.
- Students still need strong foundational knowledge to verify AI outputs and catch mistakes.
- AI-assisted learning could help construction students understand complex topics faster and produce higher-quality work.
- The construction industry will likely value workers who can combine field knowledge with AI tools.
