The Unregulated Path To Superintelligence That Could Make Human Labor Obsolete

By [Federico Guerrini](#), Former Contributor. ⓘ Federico Guerrini is a reporter covering tech policy... 

Published Nov 27, 2025, 11:37am EST

MAIN FINDINGS AND ARGUMENTS

- AI is rapidly advancing toward Artificial General Intelligence (AGI) and potentially superintelligence.
- Superintelligence would surpass human intelligence across all cognitive tasks.
- Once AGI is achieved, it could quickly improve itself through recursive self-improvement.
- The AI industry is developing these technologies with very little regulation.
- Superintelligent systems could perform all economically valuable work better and cheaper than humans.

BROADER IMPLICATIONS FOR SOCIETY

- Widespread job displacement could occur across many industries.
- Human labor may become economically obsolete in many fields.
- There is a growing risk of humans losing control over advanced AI systems.
- Public opinion is becoming more concerned about the risks of AI.
- National regulations and international agreements may be needed to control AI development.

WHY IT MATTER IN CONSTRUCTION?

- AI could automate design, scheduling, estimating, and project management tasks.
- Robotics combined with AI could perform many physical construction activities.
- Projects could become faster, more efficient, and less expensive.
- Demand for certain construction jobs may decrease significantly.
- The future workforce will likely require more technical and AI-related skills.
